

# COMP 110/L Lecture 18

Kyle Dewey

# Outline

- `JUnit fail()`
- More two-dimensional array examples

**JUnit** fail ()

`fail()`

Triggers immediate test failure

# fail()

Triggers immediate test failure

---

```
import static org.junit.Assert.fail;
```

-Need this import at the beginning of the program

# fail()

Triggers immediate test failure

---

```
import static org.junit.Assert.fail;
```

```
@Test
```

```
public void testSomething() {
```

```
    if (someFailureCondition) {
```

```
        fail();
```

```
    }
```

```
}
```

# Example

- `FailExample.java`
- `FailExampleTest.java`

# `fail()` Utility

- Some test failures cannot be easily phrased as one value equals another value
- Occasionally more convenient
- We can define our own `assertEquals()` and `assertArrayEquals()` **using** `fail()`

# More 2D Array Examples

- `PrintRow2D.java`
- `PrintCol2D.java`
